

Test beam 2004

ROB Problems

Errors on cabling SL-ROB?

- Tracks on Run>2739 shows problems on the channel map of Phi SIs of chamber 2
- It seems that ROB#3 TDC0 interchanged with TDC3.
- On addition TDC0 has not hits

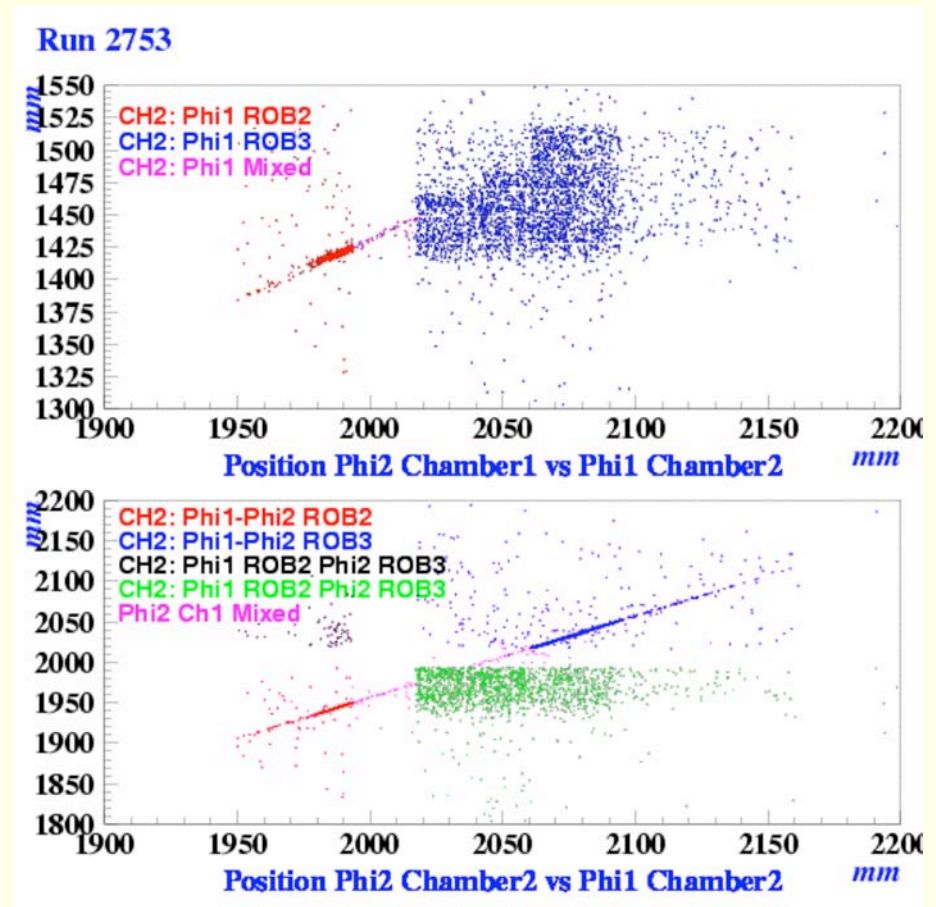

Problems on correlating tracks

- There are problems for correlating tracks between chambers when $Cell > 48$ on chamber 2

- The same kind of problems observed when correlating tracks on both phi SL's of chamber 2 in the region of cells 48-49

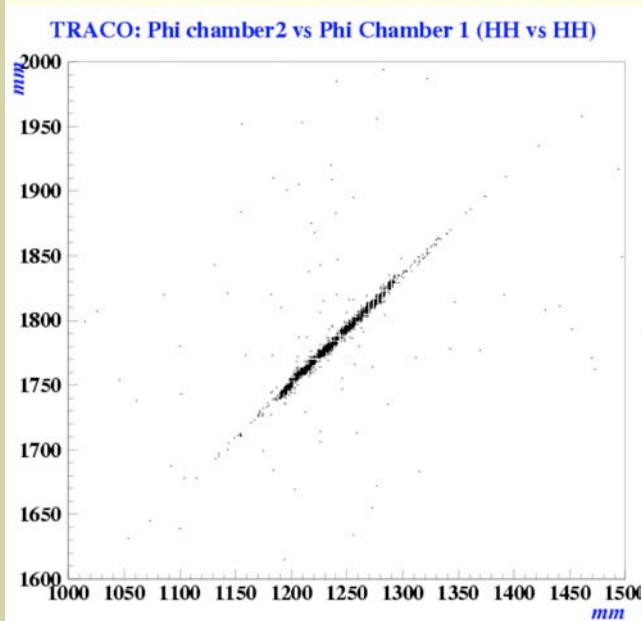

➡ It seems that muons on ROB3 of chamber 2 are not the triggered ones !!

Synchronization errors????

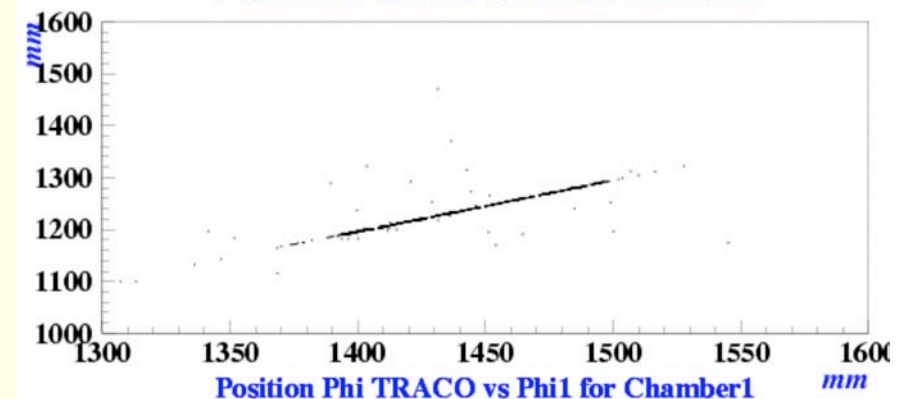

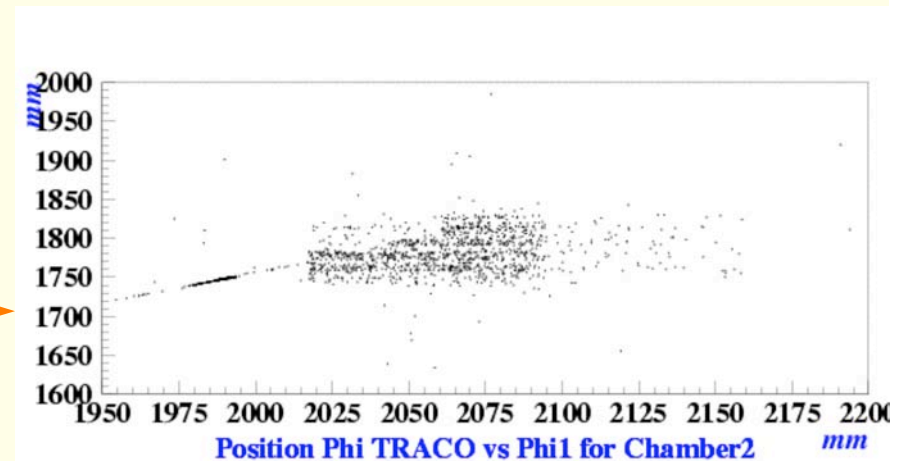

Problems on correlating tracks (II)

When comparing the information of TRACO's of both chambers

Information from both TRACOs match well

- TRACO position for chamber 2 is not correlated with chamber information when hits are on ROB-3
- Chamber 1 → O.K

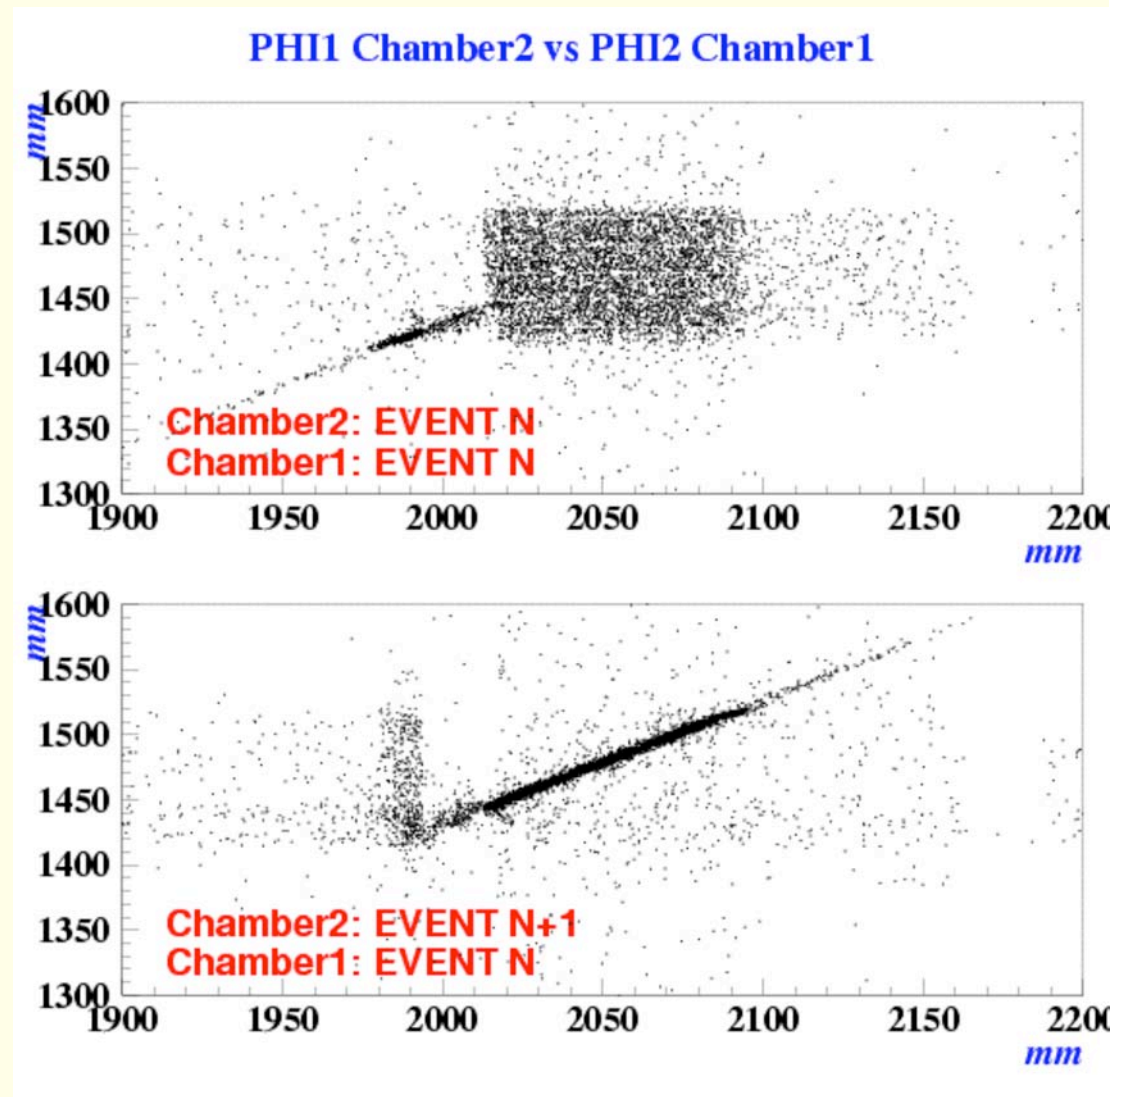

Problems on correlating tracks (III)

Could be a shift on the event number in between both ROB's ?

Data of chamber 2 from ROB2 is not correlated with the **SAME** event of chamber 1

BUT

Data of chamber 2 from ROB3 is correlated with the **PREVIOUS** event of chamber 1

What is happening?

- There are cabling errors SL - ROBs?
BUT, this is not observed by the TRACO
- The muons found by ROB-3 on chamber 2 are **not correlated** with the muons on chamber 1 and on TRACO.
- The muons from ROB-3 on chamber 2 corresponds to the **previous event** of chamber 1

Looking to Raw data

In order to understand the problems we plunged into the raw data

Some problems found

Processing ROB raw data

Bad ROB configuration

Looking for Minicrate configuration, we found, for example, in between run 2254 (good) and 2256 (bad), the following configuration files on the LogBook

Logbook
Page 21

- The Scan proceeds:
 - 15ns → run 2245
 - 16ns → run 2246
 -
 - 24ns → run 2254
- At 7:30 TEST PULSE (200 events)
 - file ~~syncro-TP-15deg-42-0-run2255~~ syncro-TP-15deg-42-0-run2255
 - L1A delay = 0
- MINICRATES configured:

CONFIG_TB2004/TB2004-mb1-41.cfg (mb1)
 CONFIG_TB2004/TB2004-mb3-41.cfg (mb3)
 CONFIG_TB2004/TB2004-mb3-plinON.cfg (mb3)
- STARTED scanning in phase (10k event per run)

| | | |
|------------------|----------|----------------------------------|
| L1A DELAY = 0 ns | RUN 2256 | FILE = syncro-15deg-41-0-run2256 |
| L1A DELAY = 1 ns | RUN 2257 | FILE = syncro-15deg-41-1-run2257 |
| L1A DELAY = 2 ns | RUN 2258 | FILE = syncro-15deg-41-2-run2258 |

| L1A delay = 3 ns | RUN 2259 | FILE = syncro-15deg-41-3-run2259 |

06/20/04 8h FLN + MD

Bad ROB configuration

Looking the ROB configuration inside these files we found:

TB2004_mb1_41.cfg (mb1) → Configuration of ROB's of ROS1. ALL O.K

TB2004_mb3_41.cfg (mb3) → Configuration of ROB's of ROS2. ALL O.K

TB2004_mb3_phiON.cfg (mb3)

It re-configures ONLY TDC0 of ROB3 of ROS2

It define TDC0 as master

(BUT TDC3 was also configured as master previously → 2 masters)

It assigns to TDC0 number 3

(BUT TDC3 was also configured as 3 previously)

The hits on TDC0 channels and TDC3 channels are all of them associated to TDC3

A ROB was configured at lab with two TDC masters (as in previous files), looking to data event number mismatch between header and tail was also found

Conclusions

- ☹ Problems on some data, associate to ROB3-ROS2, were found
- ☹ They were due to a bad configuration of this ROB.
- ☹ For these problematic runs, data from this ROB should be through away.
